## **EXECUTIVE SUMMARY**

The Regency at the Park project will be located on the west side of East Ponce de Leon Boulevard between Santillane and Calabria Avenues. The existing site currently contains 16 residential units. The project proposes 153 residential units and 8 work/live units on the ground floor. The project will feature an onsite parking garage with 214 parking spaces (60 tandem and 154 standard spaces). Access to the site (parking garage and loading area) is provided via a two-way driveway located on Calabria Avenue. Loading vehicles will leave the site via a one-way exit driveway on Calabria Avenue, east of the two-way driveway. The site is located within the Gables Re-development Infill District (GRID), the City's traffic concurrency exception area.

This traffic study is consistent with the methodology previously discussed with and agreed to by the City of Coral Gables Public Works Department. For the purpose of this traffic study, project buildout is anticipated in 2020.

An assessment of the traffic impacts associated with the proposed project was performed in accordance with the requirements of the City of Coral Gables. The results of the analysis show that for the future with the project conditions the overall LOS during both the morning and afternoon peak period for the following intersections will be within the City's LOS standards:

- Ponce de Leon Boulevard / SW 8th Street
- SW 8<sup>th</sup> Street / Galiano Street
- SW 8th Street / SW 37<sup>th</sup> Avenue
- SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue
- Ponce de Leon Boulevard / Salamanca Avenue

As with existing and future without project conditions, the software continues to project delays for the northbound approach of the SW 8<sup>th</sup> Street / Ponce de Leon Boulevard intersection during the

PM peak period. Even though the overall LOS is projected to be within the City's LOS standards, signal timing adjustment are recommended for this intersection. Two seconds of green time were added to the northbound left-turn movement to improve approach delays. The westbound approach of the SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue intersection also continues to experience delay during the AM peak period. These delays may be due to the fact that the County, with the consent of the State, gives priority to vehicles traveling on SW 37<sup>th</sup> Avenue therefore, accepting delays on minor cross streets.

In addition, a mobility and circulation plan was completed as part of the study. The plan shows that the project area is currently served by Miami-Dade Transit bus routes, and the City of Coral Gables Trolley. The project is located in an area that is conducive for pedestrian and bicycle activities providing ample sidewalks, and crosswalks.

A multimodal level of service analysis for pedestrian, bicycle, and transit was also performed for each scenario as part of the traffic study. The results show that pedestrian, bicycle, and transit modes on all segments will range within acceptable LOS.

## 1.0 INTRODUCTION

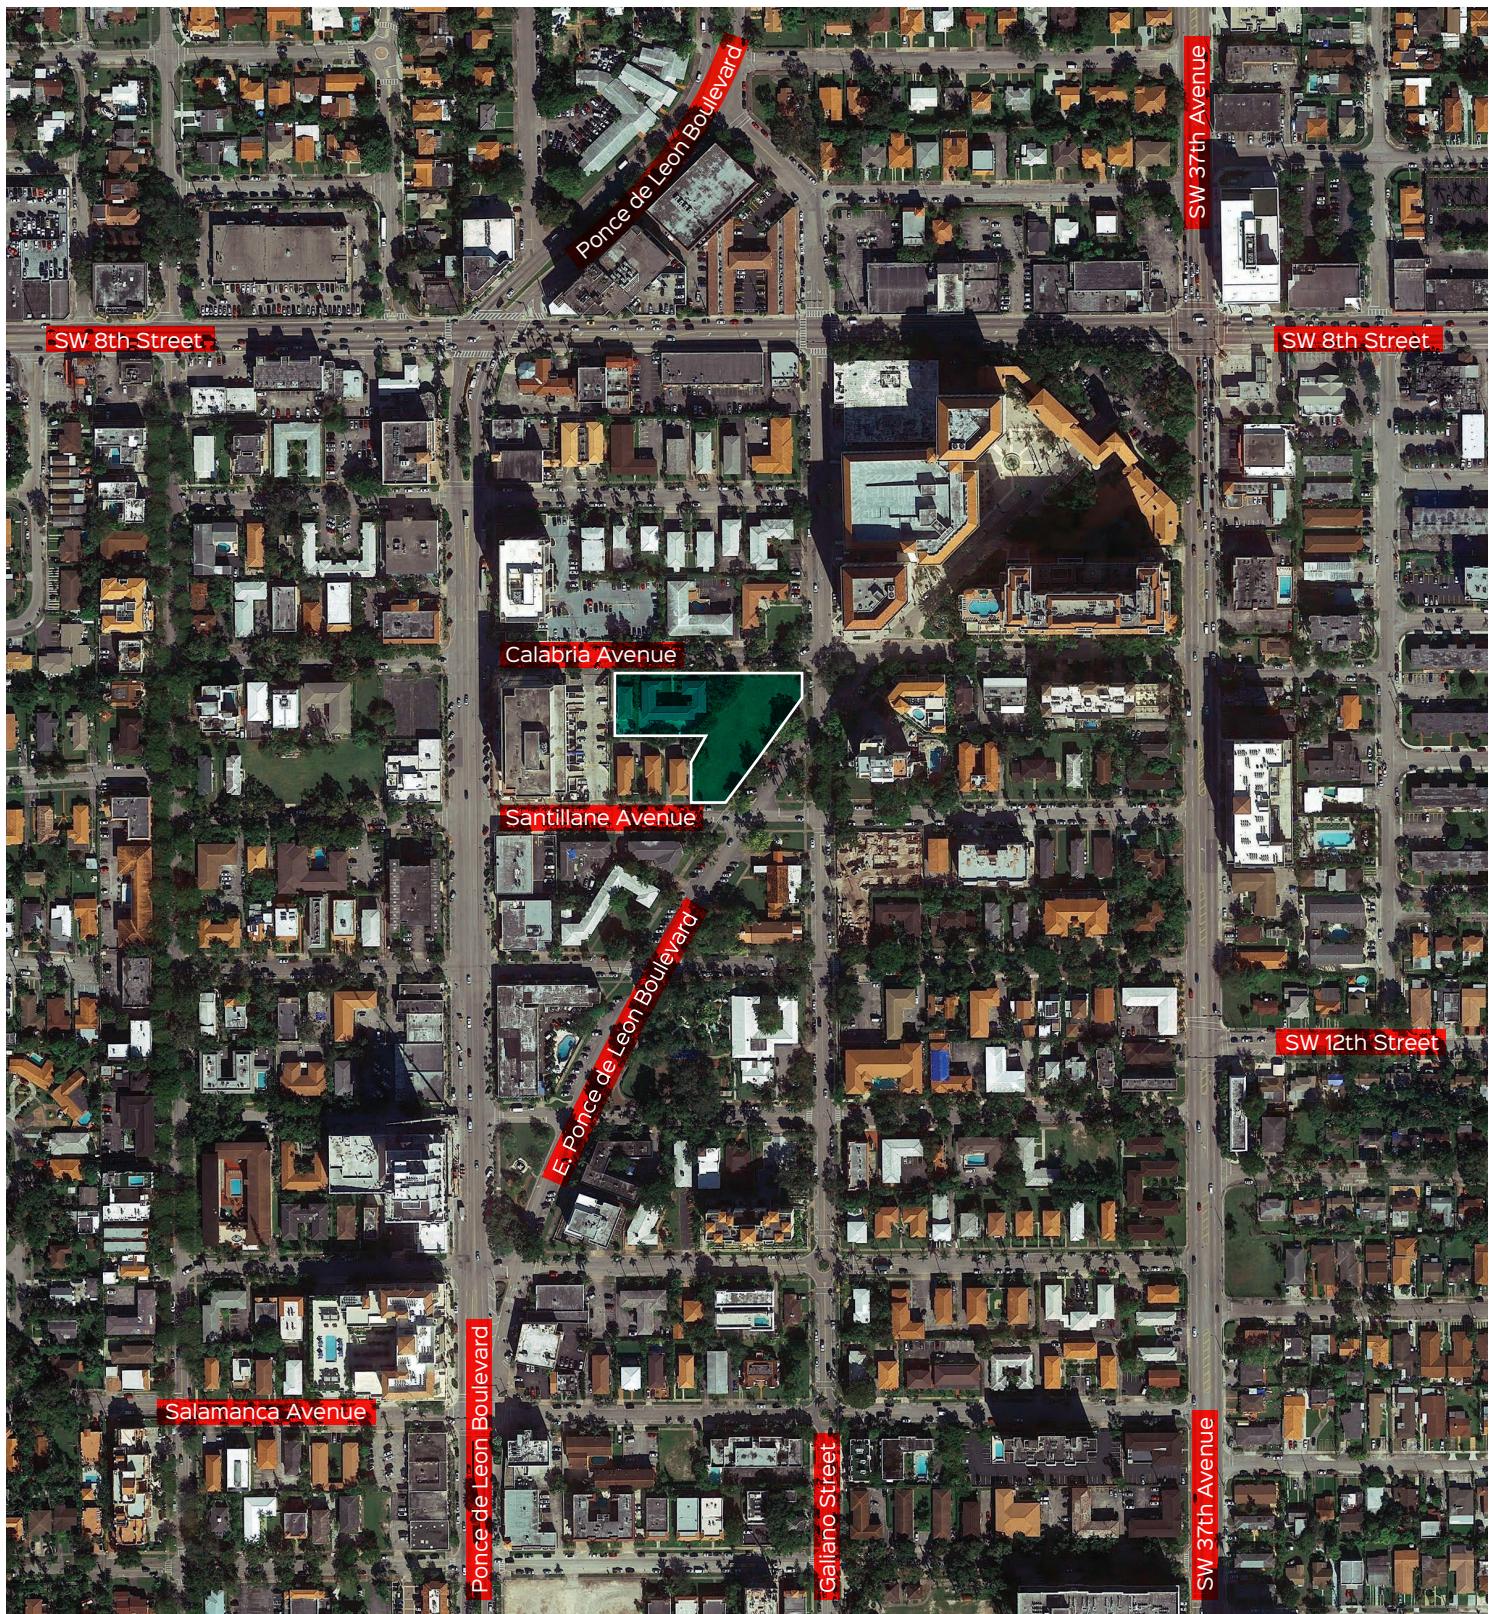

### 1.1 Project Background

The Regency at the Park project will be located on the west side of East Ponce de Leon Boulevard between Santillane and Calabria Avenues (see Exhibit 1). The existing site currently contains 16 residential units. The project proposes 153 residential units and 8 work/live units on the ground floor. The project will feature an onsite parking garage with 214 available parking spaces (60 tandem and 154 standard spaces). Access to the site (parking garage and loading area) is provided via a two-way driveway located on Calabria Avenue. Loading vehicles will leave the site via a one-way exit driveway on Calabria Avenue, east of the two-way driveway. The site is located within the Gables Re-development Infill District (GRID), the City's traffic concurrency exception area.

This traffic study is consistent with the methodology previously discussed with and agreed to by the City of Coral Gables Public Works Department. For the purpose of this traffic study, project buildout is anticipated in 2020.

### 1.2 Study Objective

The purpose of the study is to provide a traffic study that meets the requirements of the City of Coral Gables for the project. This study includes vehicular flow, trip generation, and intersection analyses.

 Project Location

## Exhibit 1

### Location Map

### **1.3 Study Area and Methodology**

The analysis undertaken follows the study methodology previously discussed with and approved by the City of Coral Gables Public Works Department (See Appendix B). A synopsis of the methodology is as follows:

- **Traffic Counts (Intersections)** – Two-hour turning movement counts were collected for the AM (7-9 AM) and PM (4-6 PM) hours on April 12, 2018 at the following intersections:

- SW 8<sup>th</sup> Street / Ponce de Leon Boulevard (S)
- SW 8<sup>th</sup> Street / Galiano Street (S)
- SW 8<sup>th</sup> Street / SW 37<sup>th</sup> Street (Douglas Road) (S)
- SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Street (Douglas Road) (S)
- Ponce de Leon Boulevard / Salamanca Avenue (S)

S= Signalized

- **Signal Location and Timing** – Existing signal phasing and timing for the signalized intersections were obtained from Miami-Dade County.
- **Trip Generation** – project trips were estimated using trip generation information published by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10<sup>th</sup> Edition.
- **Trip Distribution / Trip Assignment** – Net new external project traffic was assigned to the adjacent street network using the appropriate cardinal distribution from the Miami-Dade Long Range Transportation Plan Update, published by the Metropolitan Planning Organization. Normal traffic patterns were also considered when assigning project trips.
- **Background Traffic** - Available Florida Department of Transportation (FDOT) and Miami-Dade County (MDC) counts were consulted to determine a growth factor consistent with

historical annual growth in the area. The growth factor was applied to the existing traffic volumes to establish background traffic.

- Future Transportation Projects – The 2017 TIP and the 2040 LRTP were reviewed and considered in the analysis at project build-out.
- Committed Developments – The following committed developments will be included in the analysis:
  - Ofizzina
  - University of St. Augustine ( at Douglas Entrance)
  - Casa Antilla
- Intersection analysis was done using the Synchro 10 software based on the Highway Capacity Manual (HCM 6<sup>th</sup> Edition). Operation analysis at driveways providing access to/from the site was also be conducted.
- Multimodal Considerations - Pedestrian, bicycle and transit facilities are defined in a Circulation Plan. Existing bus and mass transit routes including schedule and bus stop locations are discussed as part of the study.
- Multimodal Analyses – Multi-Modal Level of Service (MMLOS) analyses were performed based on LOSPLAN 2012 which uses methodology from the FDOT Quality/Level of Service Handbook. MMLOS analyses were performed for the following roadway segments:
  - Ponce de Leon Boulevard
  - East Ponce de Leon Boulevard
  - Galiano Street

## 2.0 DATA COLLECTION

Data collection for this study included roadway characteristics, intersection traffic counts, signal timing, and seasonal adjustment factors. The data collection effort is described in the following sections.

### 2.1 Roadway Characteristics

#### Ponce de Leon Boulevard

Ponce de Leon Boulevard is an urban collector that provides north/south access throughout the City of Coral Gables Central Business District (CBD). Within the study area, Ponce de Leon Boulevard is a two-way, four-lane, undivided roadway. There is on-street, metered, parking provided on both sides of the roadway. The City of Coral Gables operates and maintains Ponce de Leon Boulevard. The posted speed limit is 30 mph.

#### SW 37<sup>th</sup> Avenue (Douglas Road)

SW 37<sup>th</sup> Avenue is a minor arterial that provides north/south access throughout Miami-Dade County. Within the study area, Douglas Road is a two-way, four-lane, divided roadway. On street parking is prohibited. Miami-Dade County has jurisdiction over Douglas Road. The posted speed limit is 40 mph.

#### Galiano Street

Galiano Street is a local roadway that provides north/south access within the City of Coral Gables. Within the study area, Galiano Street is a two-way, two-lane, undivided roadway. On street parking is allowed on portions of the roadway. The City of Coral Gables has jurisdiction over Galiano Street. The speed limit is not posted within the study limits, however, if not posted, the City's speed limit is 30 mph.

#### SW 8<sup>th</sup> Street (US-41)

SW 8<sup>th</sup> Street is a state principal arterial that provides east/west access throughout Miami-Dade County. Within the study area, SW 8<sup>th</sup> Street is a two-way, four-lane, undivided roadway. An

exclusive left turn lane is provided at every intersection within the study area. On street parking is prohibited. Florida Department of Transportation (FDOT) has jurisdiction over SW 8<sup>th</sup> Street. The posted speed limit is 35 mph.

#### Salamanca Avenue

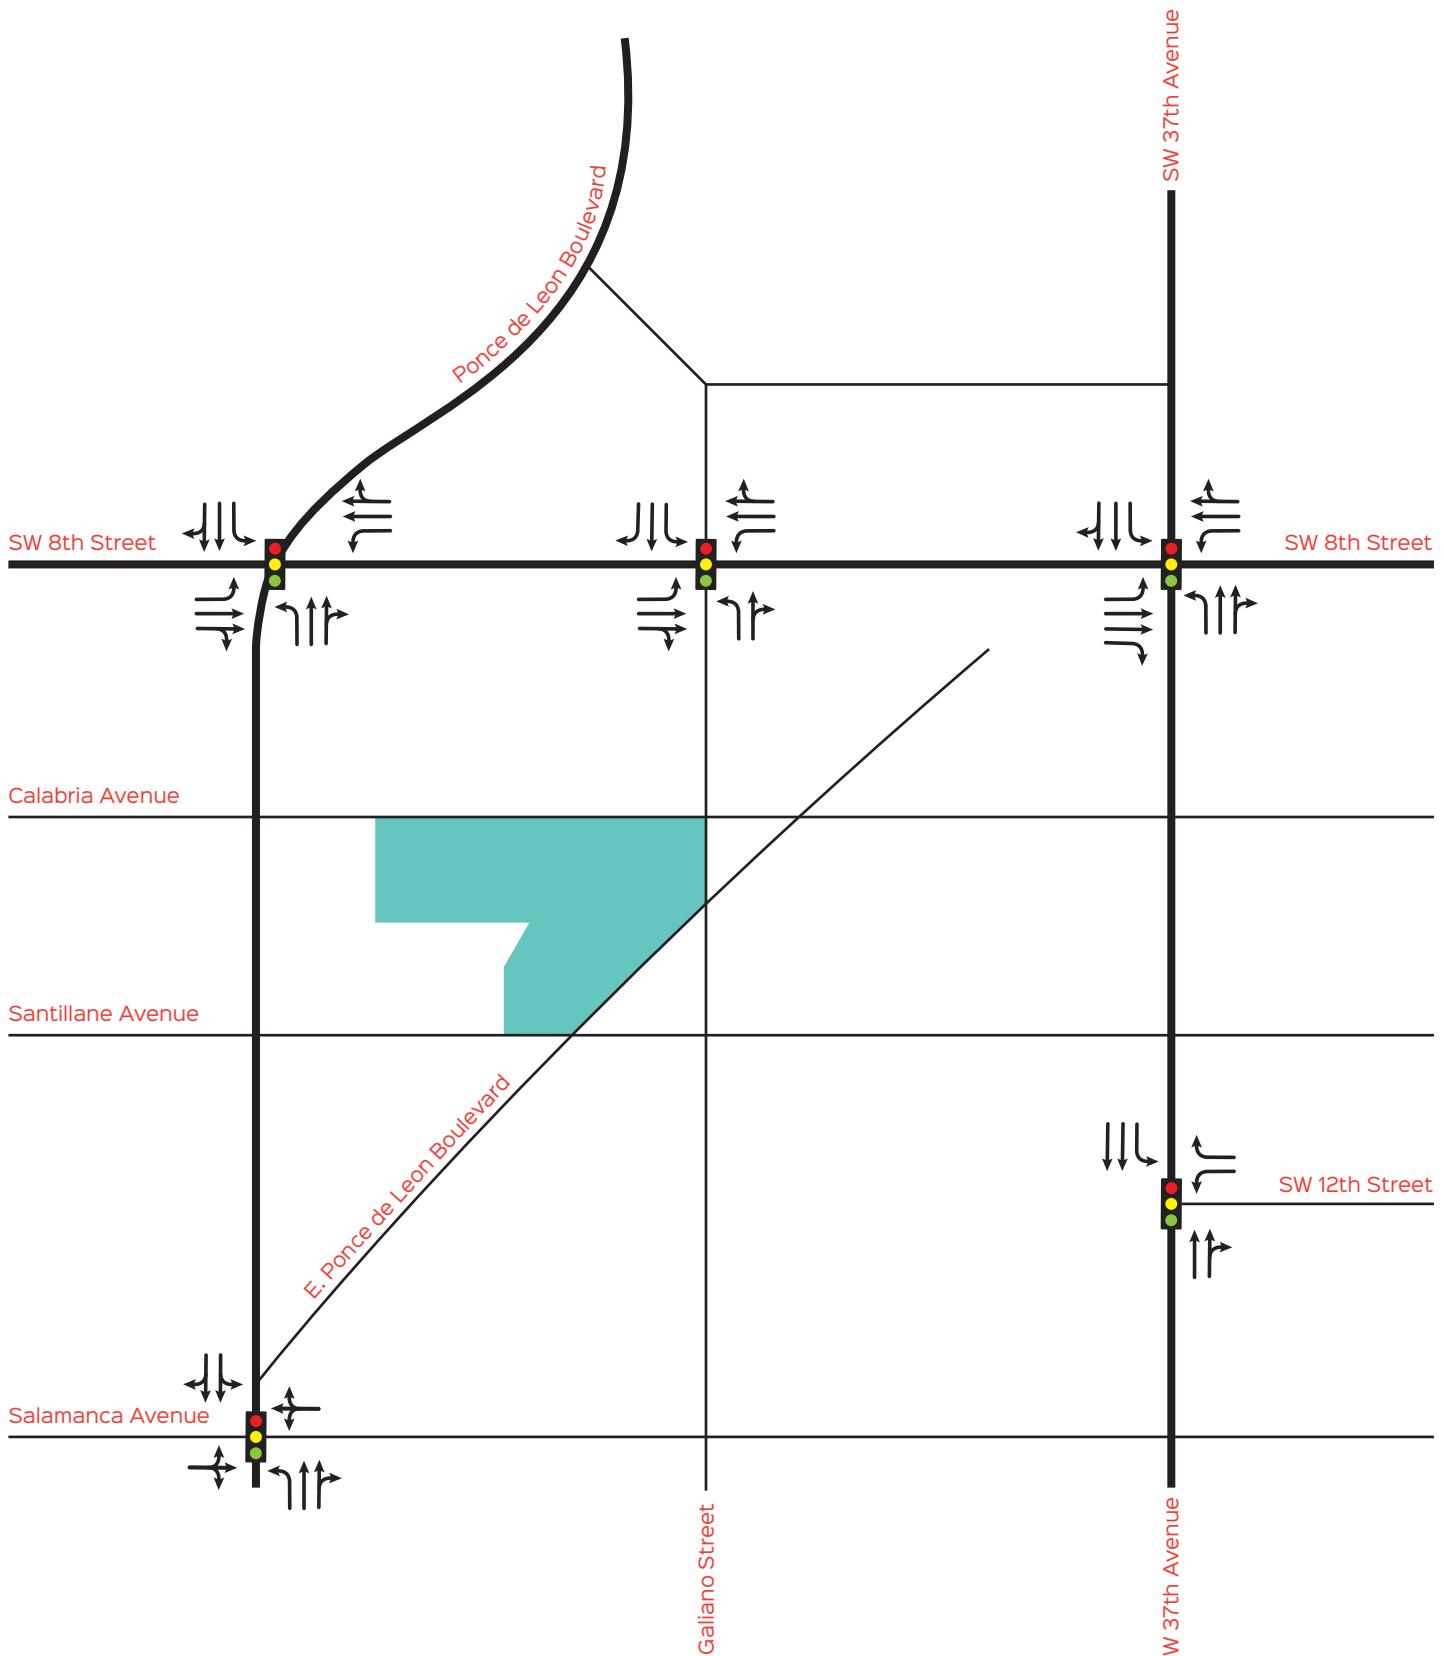

Salamanca Avenue is a local roadway that provides east/west access within the City of Coral Gables. Within the study area, Salamanca Avenue is a two-way, two-lane, undivided roadway. On street parking is allowed on portions of the roadway. The City of Coral Gables has jurisdiction over Salamanca Avenue. The speed limit is not posted within the study limits, however, if not posted, the City's speed limit is 30 mph.

## **2.2 Traffic Counts**

Vehicle turning movement counts were collected on April 12, 2018 at the study intersections during the AM and PM peak periods. The counts were adjusted to reflect average annual daily traffic conditions using the latest weekly volume adjustment factors obtained from FDOT. A weekly volume adjustment factor of 0.98 (Miami-Dade County South) corresponding to the dates of the counts was applied. Traffic counts and FDOT season factors are provided in Appendix C.

## **2.3 Intersection Data**

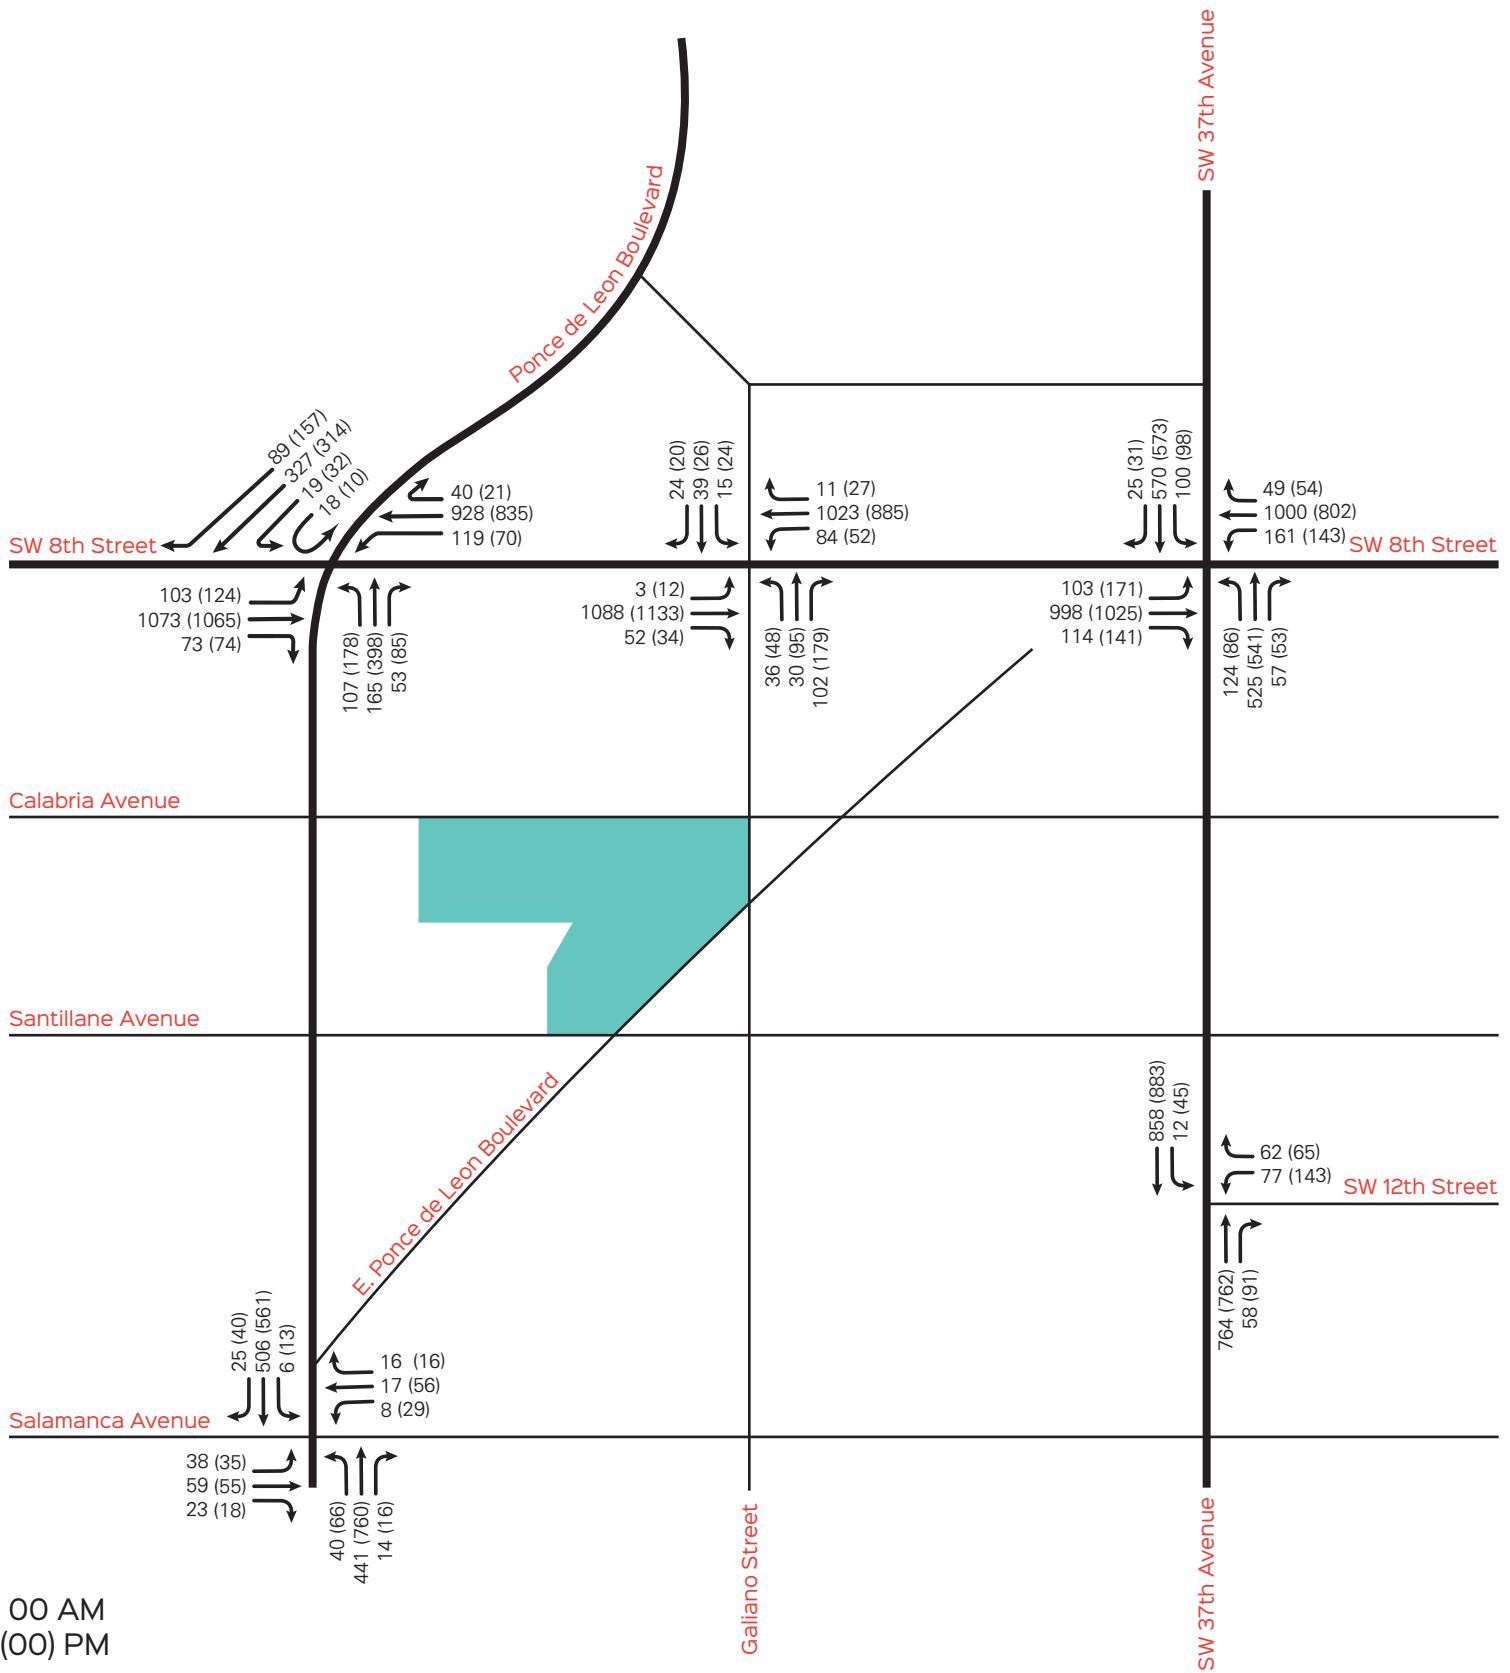

Signal timing data was obtained from Miami-Dade County for the signalized intersections analyzed in this study. This information was used for the signal phasing and timing required for the intersection capacity analysis. A field survey was also conducted to obtain the intersection lane configurations to be used in the intersection analysis. Exhibit 2 shows the existing lane configurations at the analyzed intersections. Existing volumes for the morning and afternoon peak period at the intersections analyzed are shown in Exhibit 3. The signal timings are provided in Appendix C.

## Exhibit 3

Existing AM & PM Peak Period Traffic Volumes

## **2.4 Other Modes of Transportation**

Pedestrian activity is an essential element within the study area. The project site is located in an area where pedestrian activity is common between the existing site and surrounding properties. Furthermore, the Coral Gables Trolley (which traverses the Ponce de Leon Boulevard corridor and loops around Galiano and Calabria Avenues) provides frequent service to the area and connects with the Douglas Road Metrorail Station.

The closest trolley stop to the project site is located on the southeast corner of Ponce de Leon Boulevard and Calabria Avenue, approximately 400 feet from the project site. This area is also serviced by the Miami-Dade Transit bus routes 8 and 37. Route 8 connects to the Brickell Metro Rail station and FIU. The closest route 8 bus stop to the project is approximately 0.2 mi from the project site on SW 8<sup>th</sup> Street and Galiano Street. Route 37 connects the area to the Miami International Airport (MIA), the Miami Intermodal Center (MIC), the Tri-rail, and the Douglas Road and South Miami Metrorail stations. The closest route 37 bus stop is approximately 0.2 mi on the east side of SW 37<sup>th</sup> Avenue, north of SW 9<sup>th</sup> Terrace. Section 5.0 of this report provides a discussion of pedestrian and transit infrastructure available within the study area.

## **2.5 Intersection & Multi-Modal Level of Service Analysis - Existing Conditions**

The Synchro 10 software was used to perform intersection capacity analysis at the study intersections. Synchro is a macroscopic analysis and optimization software application that implements the Highway Capacity Manual's methodology for signalized / un-signalized intersections. The resulting intersection LOS for existing conditions during morning and afternoon peak periods are shown in Exhibit 4. The results show that the overall LOS for all intersections operate within the City's LOS standards. However, the northbound approach of the SW 8<sup>th</sup> Street / Ponce de Leon Boulevard intersection experiences minor delays during the PM peak period. Minor delay is also experienced in

the westbound approach of the SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue intersection during the AM peak period. These delays may be due to the fact that the County, with the consent of the State, gives priority to vehicles traveling on SW 8<sup>th</sup> Street and SW 37<sup>th</sup> Avenue therefore, accepting delays on minor cross streets.

Source: David Plummer & Associates

The 2012 LOSPLAN software was used to perform multimodal roadway segment LOS analysis for bicycle, pedestrian, and transit modes. The pedestrian and bicycle LOS score indicates the pedestrians or bicyclist perception of the overall crossing experience. Although the project area is serviced by transit within walking distance, the available transit does not traverse directly on the segment of East Ponce de Leon Boulevard. While transit does traverse the segment of Ponce de Leon Boulevard, the software does not provide the transit LOS during the PM peak period. The results for the multimodal level of service analysis are shown in Exhibit 5. Multimodal analysis worksheets are included in Appendix D.

## **3.0 PLANNED AND PROGRAMMED ROADWAY IMPROVEMENTS**

The 2017 Miami-Dade County Transportation Improvement Program (TIP) and the 2040 Long Range Transportation Program were reviewed to identify any programmed or planned projects within the limits of the study area established. These documents show the following projects within the study area:

### **Congestion Management**

**CMP31-** SW 8<sup>th</sup> Street (Tamiami Trail) from SR-826 (Palmetto Expressway) to I-95

- Signal Timing Optimization

**PW000705-** Ponce de Leon Boulevard from Salamanca Avenue to Antiquera Avenue

- Four to four lanes with left turning bays

### **Transit Improvements**

**MDT151-** Douglas Road Corridor (37<sup>th</sup> Avenue) Enhanced Bus from US-1 to Miami Intermodal Center (MIC)

- Improvement on PTP corridor

These documents show no officially programmed or planned capacity improvement projects within the study area prior to completion of the proposed project. Roadway project documentation is included in Appendix E.

## 4.0 FUTURE TRAFFIC CONDITIONS

### 4.1 Background Traffic and Committed Developments

Average Daily Traffic counts published by the Miami-Dade Public Works Department and the FDOT were reviewed to determine historic growth in the area. This analysis indicated that in the last 5 years the annual growth rate is 0.2%. For a conservative analysis, a 0.5% growth rate is applied. Historic growth rate documentation is included in Appendix C.

The City was consulted to determine any committed development in the vicinity of the project site. Three committed developments were considered for estimating future traffic volumes in this study:

- Ofizzina
- University of St. Augustine (at Douglas Entrance)
- Casa Antilla

Exhibit 6 provides a tabulation of AM and PM peak hour trips generated by the committed development, along with the approved land uses. Committed development information is included in Appendix E.

**Exhibit 6: Committed Development Trip Generation\***

| Casa Antilla   | Condominium<br>(Land Use 230)                | 44 DU           | 5                          | 22  | 27    | 21                         | 10  | 31    |
| University of St. Augustine<br>(at Douglas Entrance) | University<br>(Land Use 550)                 | 390<br>Students | 46                         | 13  | 59    | 19                         | 40  | 59    |
| Ofizzina   | General Office<br>Building<br>(Land Use 710) | 90,536 SF       | 156                        | 21  | 177   | 31                         | 149 | 180   |
|  | Drive-in Bank<br>(Land Use 912)              | 5,891 SF        | 41                         | 30  | 71    | 72                         | 71  | 143   |

\* Committed development documentation is included in Appendix E.

\* Gross vehicle trip ends. Appendix E reflects adjustments for existing land uses, pass-by, internal, and transit trips.

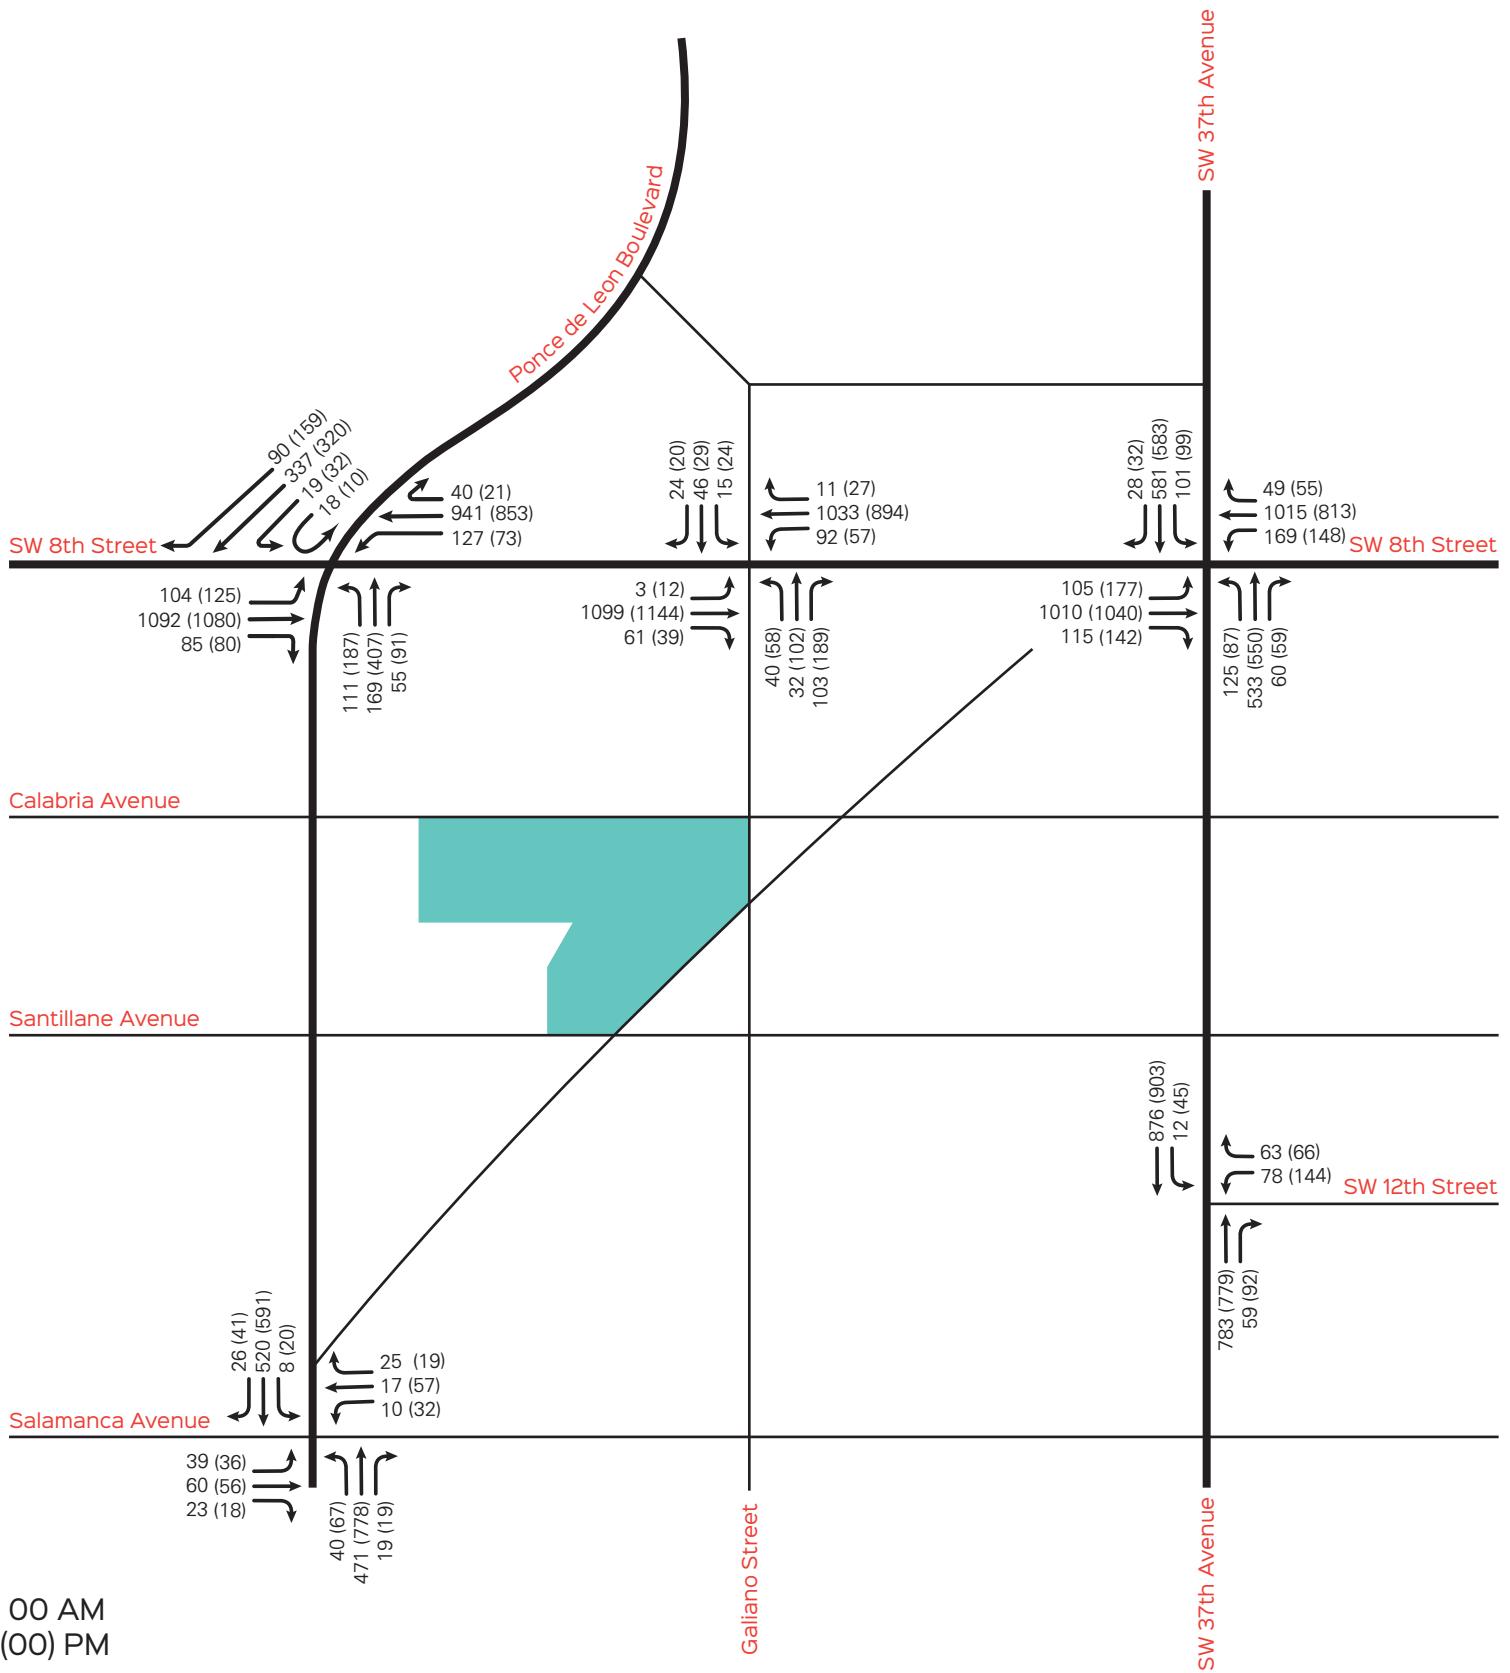

## **4.2 Intersection & Multi-Modal Level of Service Analysis - Future without Project**

Future without project conditions were obtained by adding background traffic with committed development trips. Exhibit 7 shows the projected turning movements for future without project traffic. Exhibit 8 shows the resulting intersection LOS for morning and afternoon peak period conditions for future without project. The results show that the following intersections are projected to operate within the City's LOS standards:

- Ponce de Leon Boulevard / SW 8th Street
- SW 8<sup>th</sup> Street / Galiano Street
- SW 8th Street / SW 37<sup>th</sup> Avenue
- SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue
- Ponce de Leon Boulevard / Salamanca Avenue

As in existing conditions, the northbound approach for the SW 8<sup>th</sup> Street / Ponce de Leon Boulevard intersection experiences delays during the PM peak period. The westbound approach of the SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue intersection also continues to experience delay during the AM peak period.

The results for the multimodal level of service analysis for future without project conditions are shown in Exhibit 9. As previously mentioned, the available transit does not traverse directly on the segment of East Ponce de Leon Boulevard. While transit does traverse the segment of Ponce de Leon Boulevard, the software does not provide the transit LOS during the PM peak period. The results show that pedestrian, bicycle, and transit modes on all other segments will range within an acceptable LOS. Multimodal analysis worksheets are included in Appendix D.

### 4.3 Project Trip Generation

Trip generation for the proposed project was estimated using the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10<sup>th</sup> Edition. This manual provides gross trip generation rates and/or equations by land use type. These rates and equations estimate vehicle trip ends at a free-standing site's driveways. See Appendix F for project trip generation worksheets.

The proposed development plan incorporates residential units and eight live / work units. As the live / work units satisfy the work trip needs for some residents without making a trip offsite, an internalization matrix was developed to establish the number of appropriate trips. Each live / work unit has approximately 700 SF of office space and a living unit. Therefore, the trip generation was performed using a total of 161 (153 + 8) residential units and 5,600 (8 x 700) SF of small office space (Exhibit 10). Internal capture rates used are also included in Appendix F.

The study area is pedestrian friendly and mass transit is available (see Section 5 of this report for additional pedestrian and transit information). Furthermore, the United States Census Bureau shows that 6.7% of the public within the area use other modes of transportation. However, for a conservative

analysis, a 6% adjustment was used to account for other modes of transportation. The project trip generation summary is provided in Exhibit 10.

**Exhibit 10: Project Trip Generation Summary**

<sup>1</sup> Based on ITE [Trip Generation Manual](#), 10<sup>th</sup> Edition,

<sup>2</sup> Based on ITE [Trip Generation Manual User's Guide and Handbook](#), 10<sup>th</sup> Edition

It should be noted that the site is currently occupied by 16 residential units. For a conservative analysis, trips associated with these units were not deducted from the trip generation.

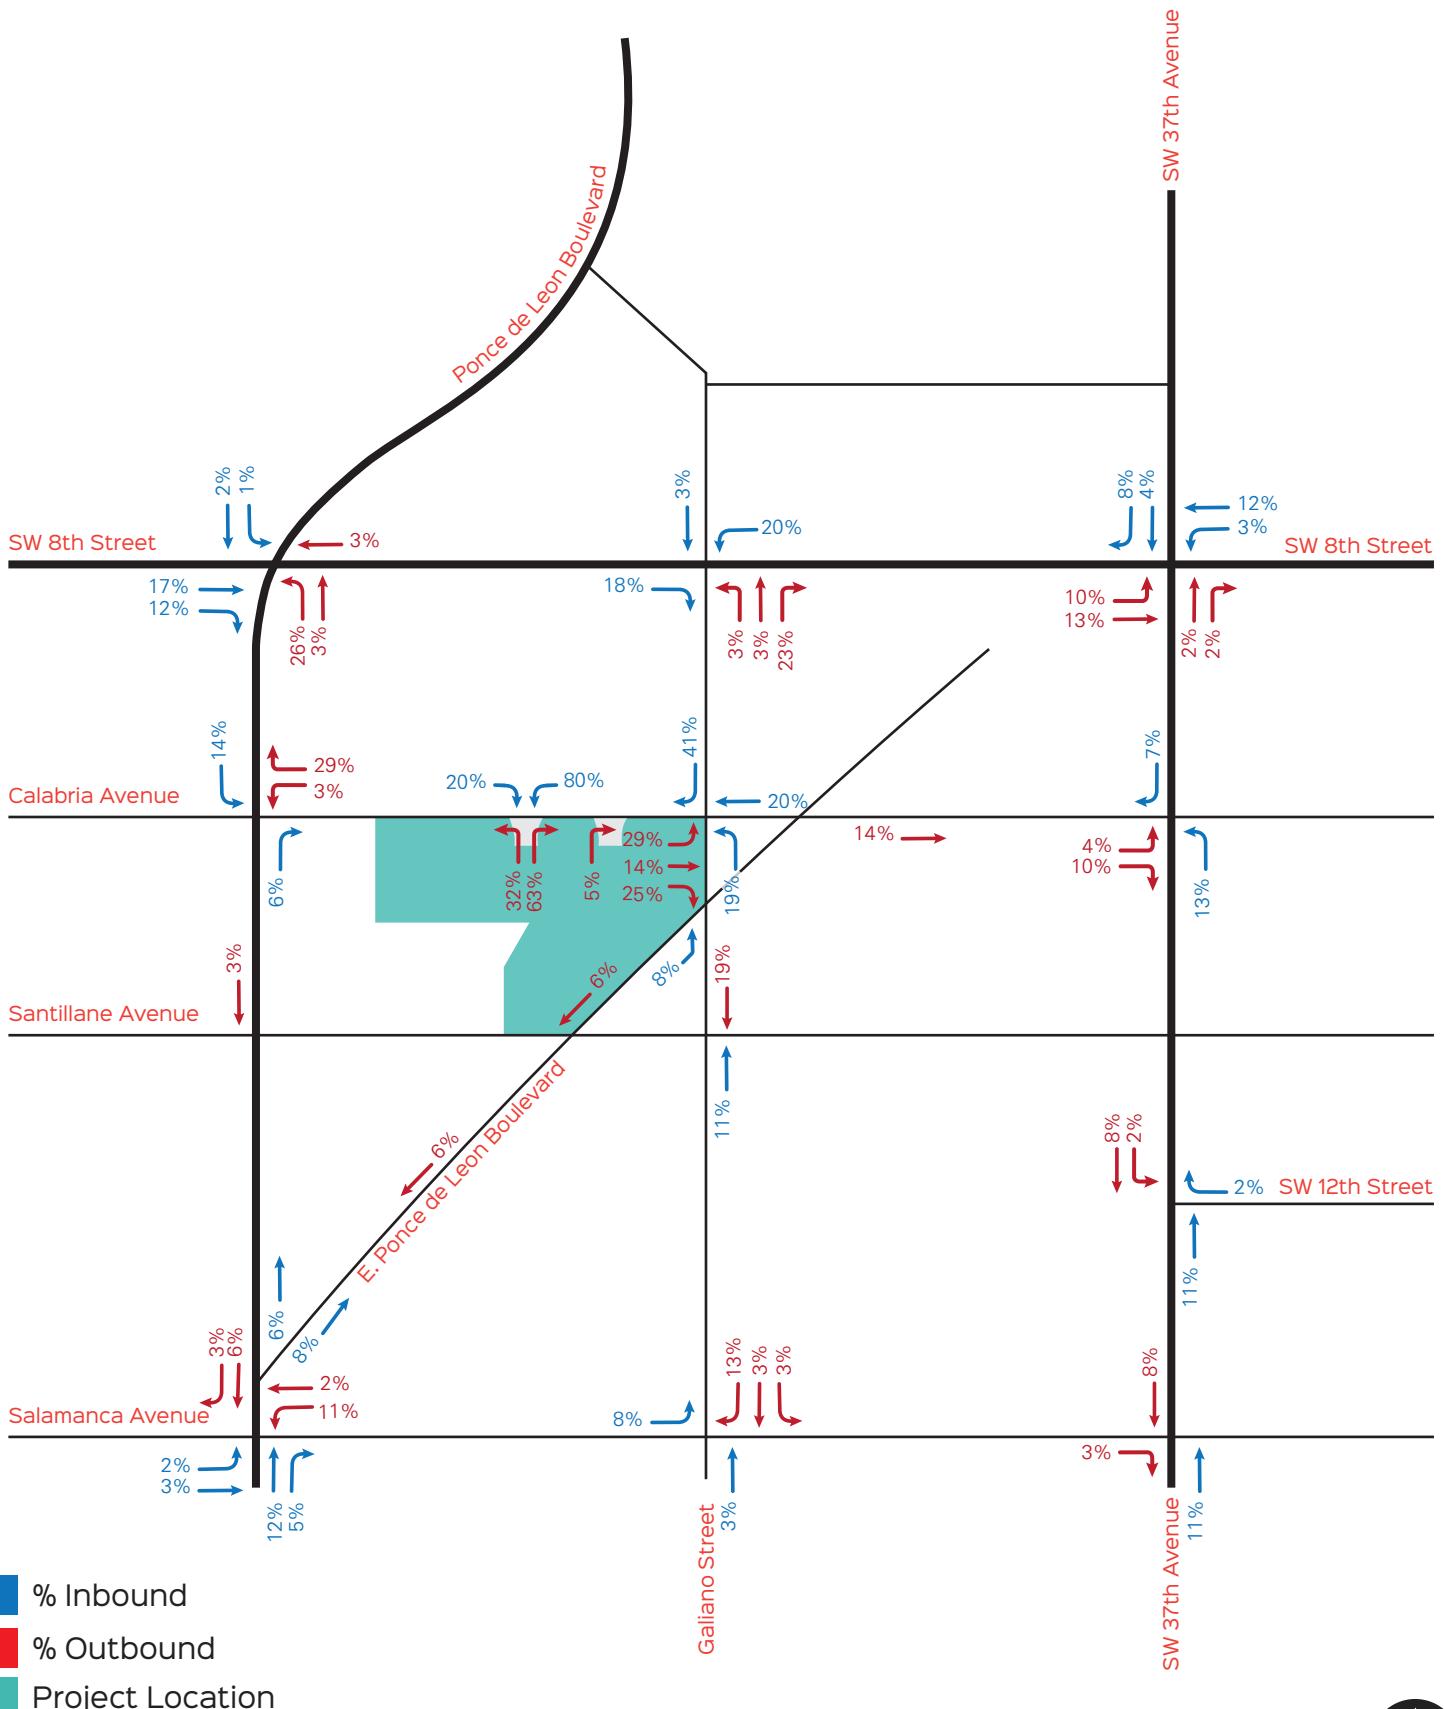

## 4.4 Project Trip Assignment

Project traffic was distributed and assigned to the study area using the Cardinal Distribution for TAZ 1054 shown in Exhibit 11. The Cardinal Distribution gives a generalized distribution of trips from a traffic analysis zone (TAZ) to other parts of Miami-Dade County. The distribution can be summarized as follows: 32.83% to the north, 20.97% to the south, 22.57% to the east, and 23.77% to the west. For estimating trip distribution for the project traffic, consideration was given to conditions such as the roadway network accessed by the project traffic, roadways available to travel in the desired direction, and attractiveness of traveling on a specific roadway. The project trip distribution at the driveways is based on the parking garage accessibility and drop-off area. Project trip distribution and project trip assignment for the proposed project are shown in Exhibit 12 and Exhibit 13, respectively.

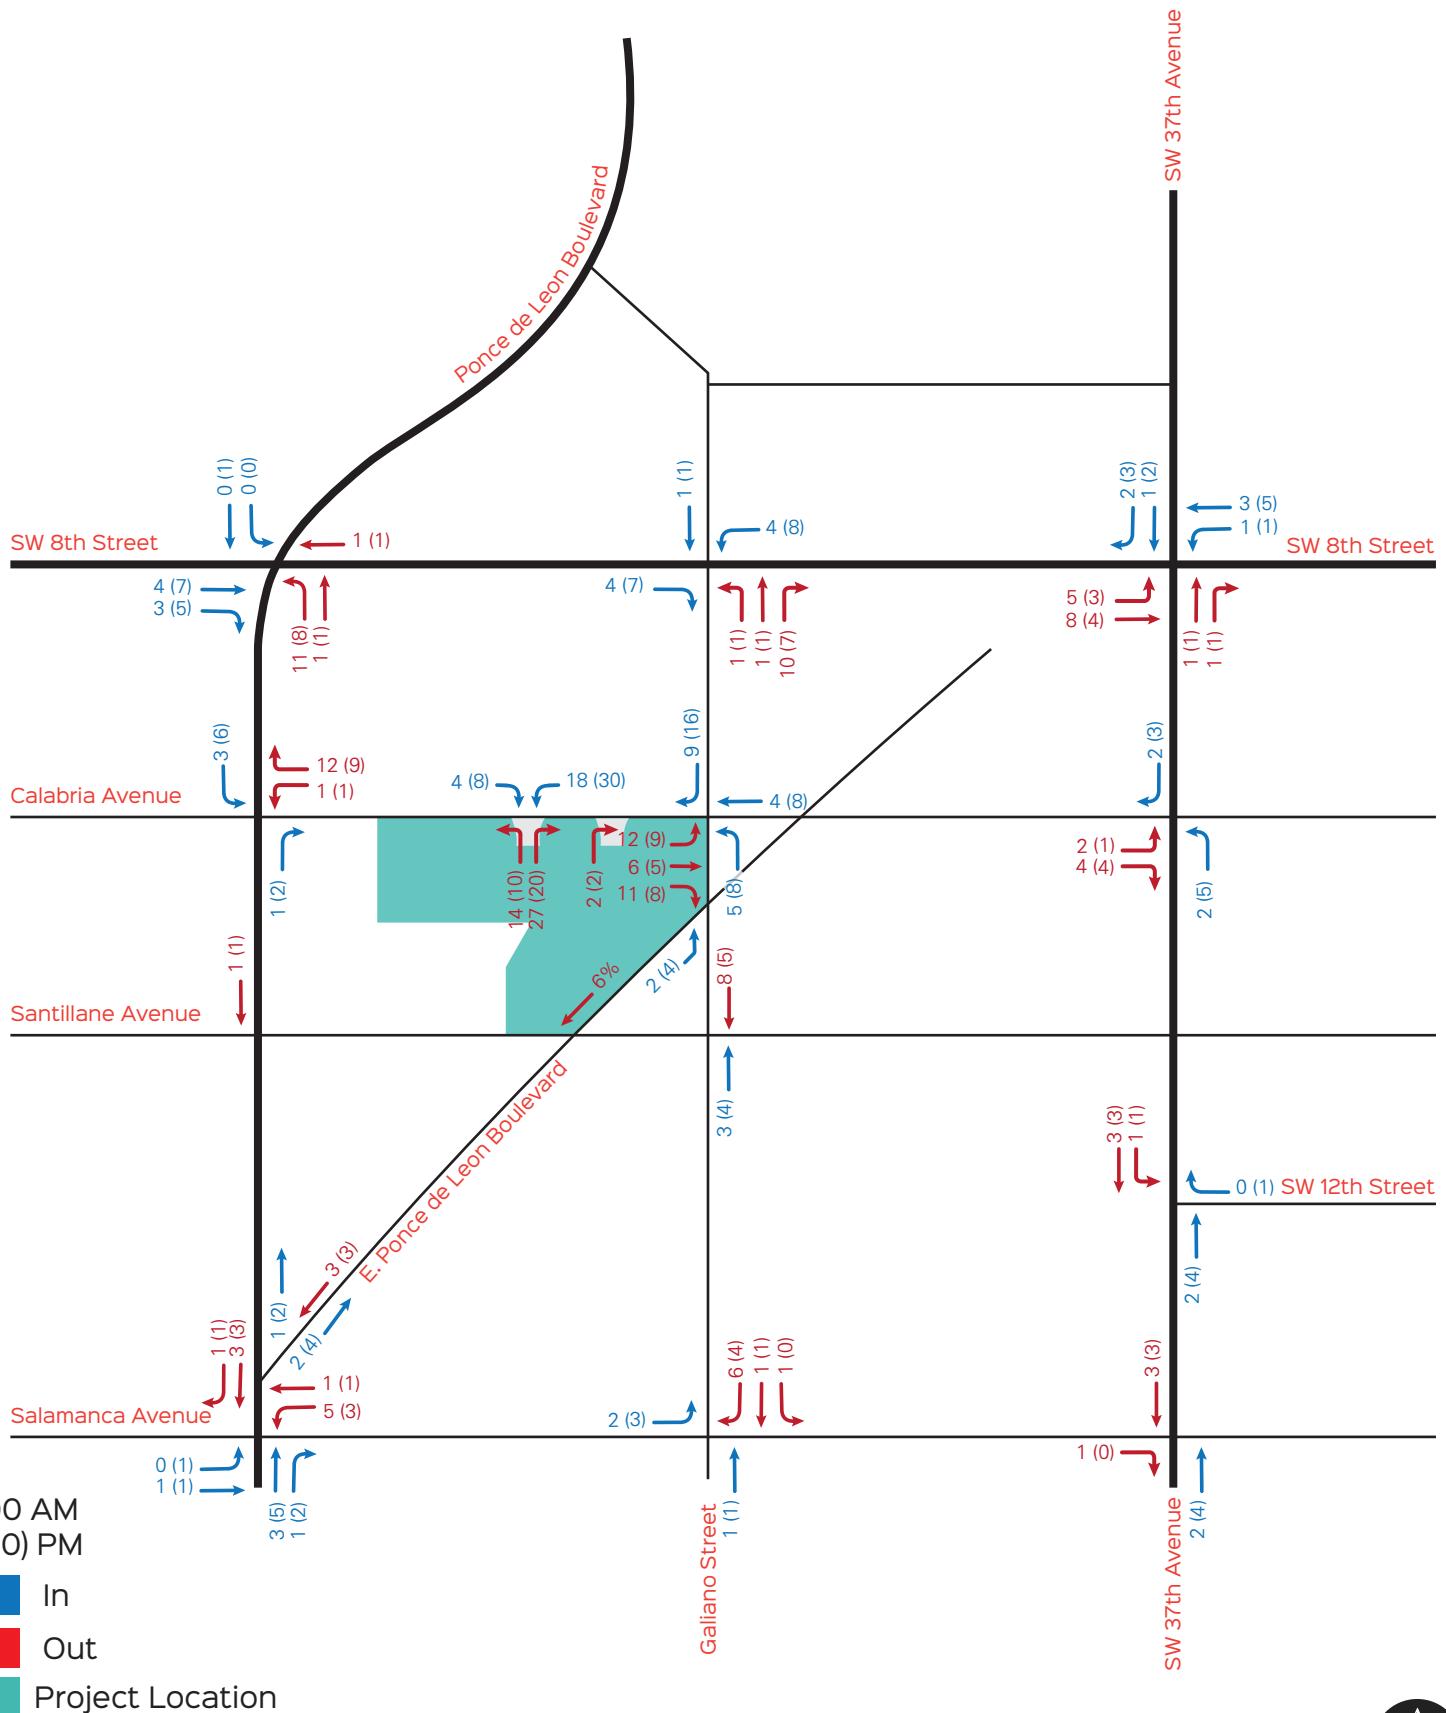

**Exhibit 11: Cardinal Distribution (TAZ 1054)**

| Direction | Distribution |
|-----------|--------------|
| NNE       | 14.73%       |
| ENE       | 17.03%       |
| ESE       | 5.53%        |
| SSE       | 6.73%        |
| SSW       | 14.23%       |
| WSW       | 12.53%       |
| WNW       | 11.23%       |
| NNW       | 18.10%       |

## Exhibit 13

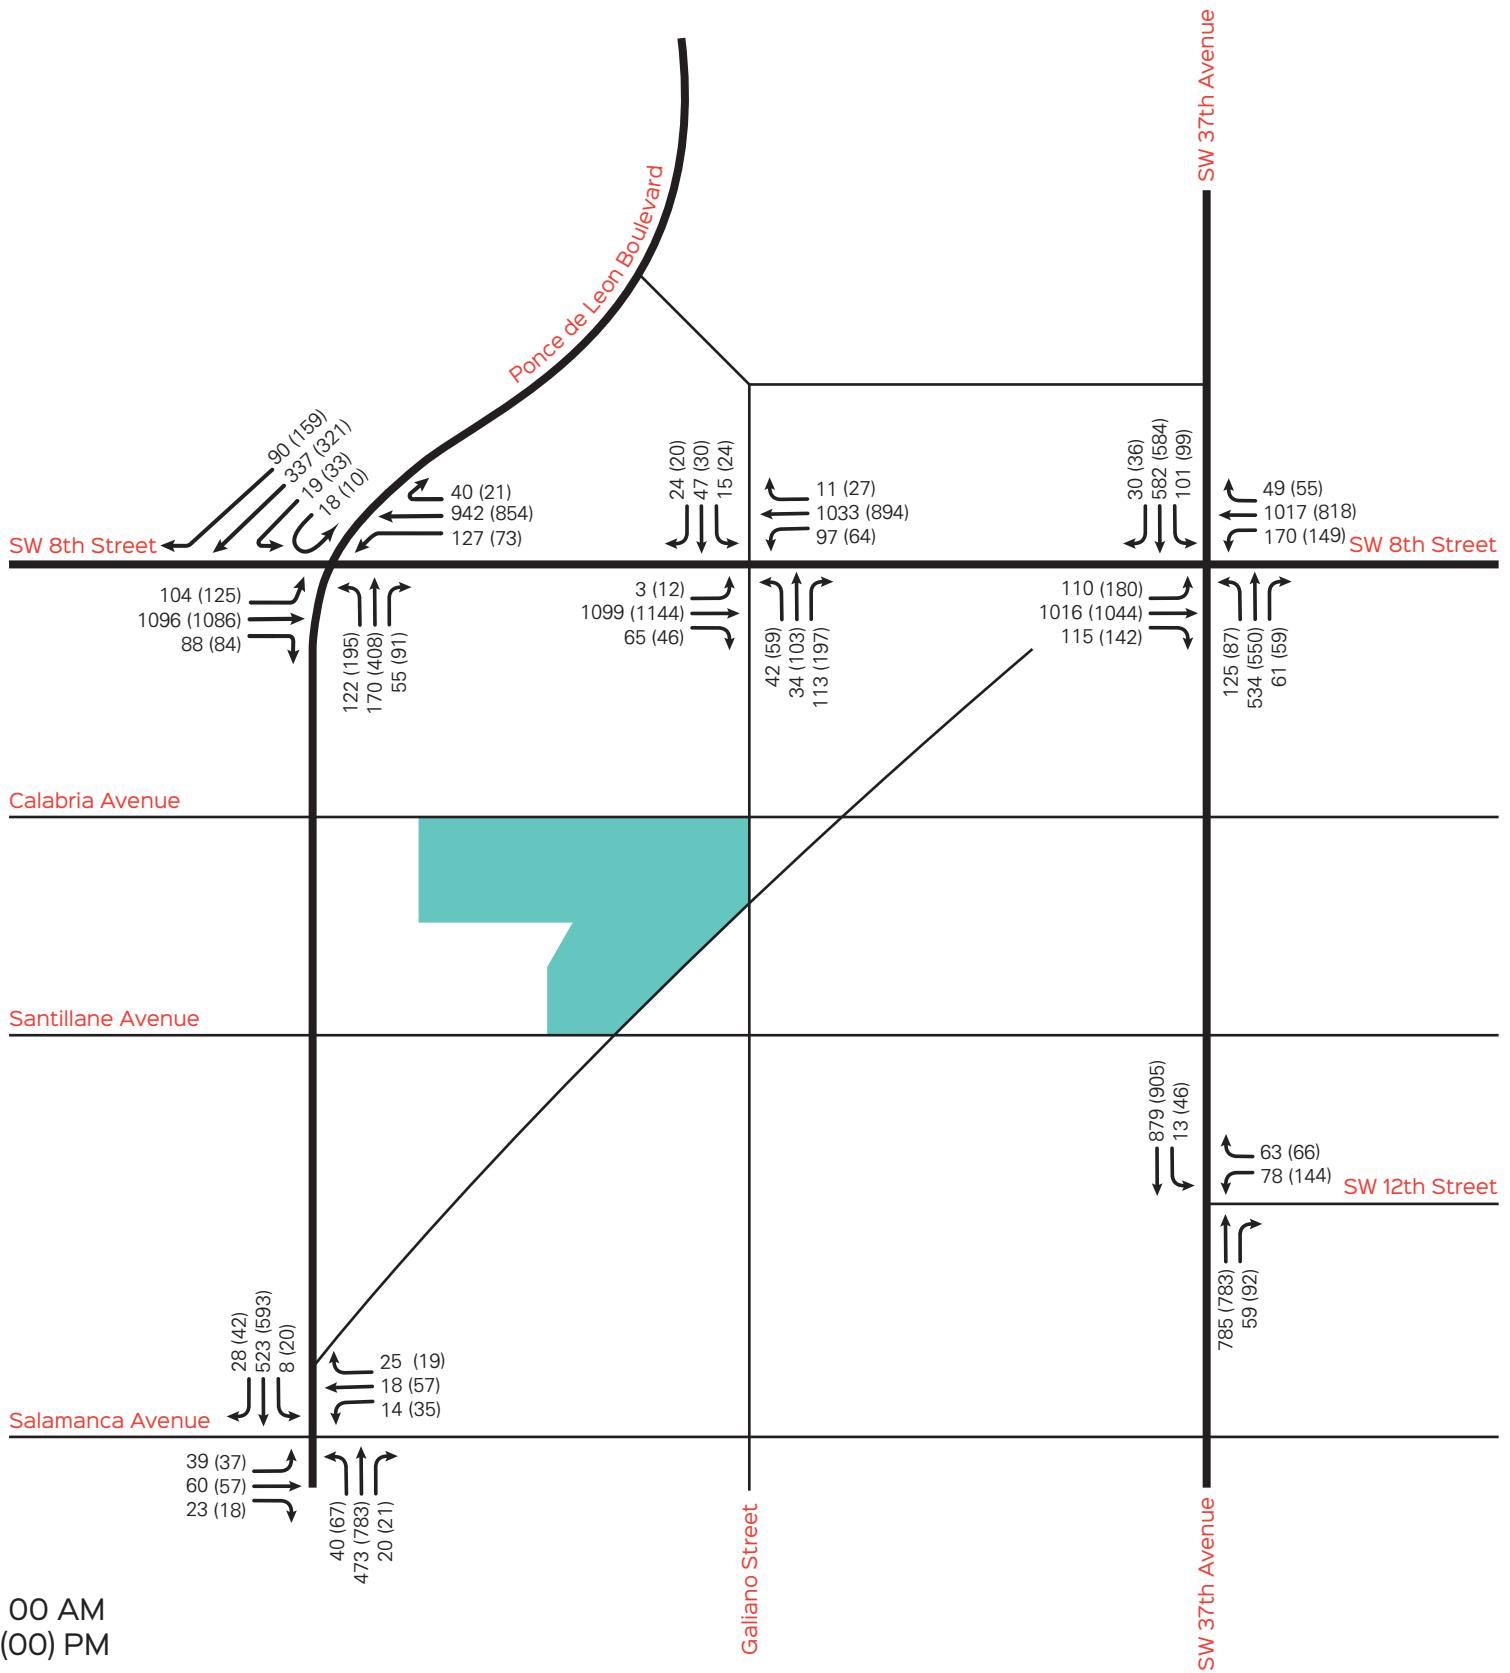

### Project Trip Assignment

## 4.5 Intersection & Multi-Modal Level of Service Analysis - Future with Project

The trip assignments in the previous section, traffic projections for the project, committed developments and background growth were combined to obtain future traffic with project at the analyzed intersections. Exhibit 14 shows the projected turning movement volumes for future with project. Exhibit 15 shows the resulting intersection LOS for the morning and afternoon peak period conditions for future with project. The results of the analysis show that for the future with the project conditions the overall LOS during both the morning and afternoon peak period for the following intersections will be within the City's LOS standards:

- Ponce de Leon Boulevard / SW 8th Street
- SW 8<sup>th</sup> Street / Galiano Street
- SW 8th Street / SW 37<sup>th</sup> Avenue
- SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue
- Ponce de Leon Boulevard / Salamanca Avenue

As previously noted, the northbound approach for the SW 8<sup>th</sup> Street / Ponce de Leon Boulevard intersection experiences delay during the PM peak period. Even though the overall LOS is projected to be within the City's LOS standards, signal timing adjustment are recommended for this intersection. Two seconds of green time were added to the northbound left-turn movement to improve approach delays. The westbound approach of the SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue intersection also continues to experience delay during the AM peak period. These delays may be due to the fact that the County, with the consent of the State, gives priority to vehicles traveling on SW 37<sup>th</sup> Avenue therefore, accepting delays on minor cross streets.

(I) PM peak LOS with signal timing improvements

Source: David Plummer & Associates

The results for the multimodal LOS analysis for future with project are shown in Exhibit 16. Although the project area is serviced by transit within walking distance, the available transit does not traverse directly on the segment of East Ponce de Leon Boulevard. While transit does traverse the segment of Ponce de Leon Boulevard, the software does not provide the transit LOS during the PM peak period. The results show that pedestrian, bicycle, and transit modes on all other segments will range within acceptable LOS. Multimodal analysis worksheets are included in Appendix D.

## **5.0 CIRCULATION PLAN**

The proposed development will be located on the west side of East Ponce de Leon Boulevard between Santillane and Calabria Avenues in Coral Gables, FL. The project proposes 153 residential units with eight work / live units. On-site parking is available on a 211 space parking garage. The project has two driveways on Calabria Avenue. The west driveway is a two-way entrance / exit driveway that provides access to the parking garage, loading area, and drop-off area. The eastern driveway is a one-way exit only for the loading and drop-off vehicles.

The project is located in an area that is conducive for pedestrian and bicycle activities. Sidewalks and on-street parking are available throughout the study area. All intersections adjacent to the site have sidewalks and clearly marked crosswalks. The signalized intersections provide pedestrian signals. A mobility plan was prepared for the site (see Exhibit 17). The plan shows the project driveways, location of street signals, sidewalk connections, and pedestrian crosswalks.

The area surrounding the project is served by transit. Miami-Dade Transit bus routes 8 and 37 traverse this area of Coral Gables. The closest bus stop (route 8) to the project is approximately 0.2 mi from the project site on SW 8<sup>th</sup> Street and Galiano Street. The Coral Gables Trolley (which traverses the Ponce de Leon Boulevard corridor) route also provides service to the surrounding project area and connects with the Douglas Road Metrorail Station. The closest trolley stop to the project site is located on Calabria Avenue and Ponce de Leon Boulevard. Exhibit 18 shows the available bus routes and bus stops in the area. Appendix G shows the bus route maps and schedules.

- Coral Gables Trolley Route

## 6.0 CONCLUSIONS

An assessment of the traffic impacts associated with the proposed project was performed in accordance with the requirements of the City of Coral Gables. The results of the analysis show that for the future with the project conditions the overall LOS during both the morning and afternoon peak period for the following intersections will be within the City's LOS standards:

- Ponce de Leon Boulevard / SW 8th Street
- SW 8<sup>th</sup> Street / Galiano Street
- SW 8th Street / SW 37<sup>th</sup> Avenue
- SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue
- Ponce de Leon Boulevard / Salamanca Avenue

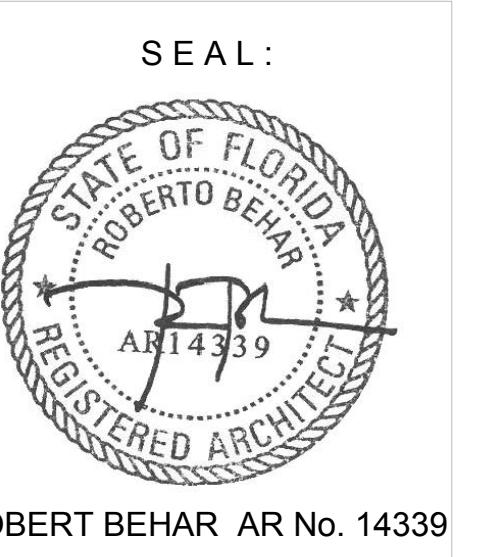

As with existing and future without project conditions, the software continues to project delays for the northbound approach of the SW 8<sup>th</sup> Street / Ponce de Leon Boulevard intersection during the PM peak period. Even though the overall LOS is projected to be within the City's LOS standards, signal timing adjustment are recommended for this intersection. Two seconds of green time were added to the northbound left-turn movement to improve approach delays. The westbound approach of the SW 12<sup>th</sup> Street / SW 37<sup>th</sup> Avenue intersection also continues to experience delay during the AM peak period. These delays may be due to the fact that the County, with the consent of the State, gives priority to vehicles traveling on SW 37<sup>th</sup> Avenue therefore, accepting delays on minor cross streets.

In addition, a mobility and circulation plan was completed as part of the study. The plan shows that the project area is currently served by Miami-Dade Transit bus routes, and the City of Coral Gables Trolley. The project is located in an area that is conducive for pedestrian and bicycle activities providing ample sidewalks, and crosswalks.

A multimodal level of service analysis for pedestrian, bicycle, and transit was also performed for each scenario as part of the traffic study. The results show that pedestrian, bicycle, and transit modes on all segments will range within acceptable LOS.

## **Methodology**

## The Regency at the Park Traffic Analysis Methodology

April 5, 2018

DPA will undertake a Traffic Impact Analysis as required by the City of Coral Gables. The analyses are for the existing conditions, future conditions with committed developments, and the future conditions with project and committed developments.

The Regency at the Park project will be located on the west side of E. Ponce de Leon Boulevard between Santillane and Calabria Avenues in Coral Gables, Florida.

**Existing Site:** 16 residential units

**Proposed Plan:** 152 residential units and 8 work/live units on the ground floor

The methodology is outlined below:

- Traffic Counts (Intersections) – Two-hour turning movement counts will be collected for the AM (7-9 AM) and PM (4-6 PM) hours on a typical weekday at the following intersections:
  - Ponce de Leon Boulevard / SW 8<sup>th</sup> Street (S)
  - Ponce de Leon Boulevard / Salamanca Avenue (S)
  - Galiano Street / SW 8<sup>th</sup> Street (S)
  - SW 37<sup>th</sup> Avenue / SW 8<sup>th</sup> Street (S)
  - SW 37<sup>th</sup> Avenue / SW 12<sup>th</sup> Street (S)
- S= Signalized  
U=Un-signalized
- Signal Location and Timing – Existing signal phasing and timing for the signalized intersection will be obtained from Miami-Dade County.
- Trip Generation – project trips will be estimated using trip generation information published by the Institute of Transportation Engineers (ITE) Trip Generation Manual, 10<sup>th</sup> Edition.
- Trip Distribution / Trip Assignment – Net new external project traffic will be

assigned to the adjacent street network using the appropriate cardinal distribution from the *Miami-Dade Long Range Transportation Plan Update*, published by the *Metropolitan Planning Organization*. Normal traffic patterns will also be considered when assigning project trips.

- Background Traffic - Available Florida Department of Transportation (FDOT) and Miami-Dade County (MDC) counts will be consulted to determine a growth factor consistent with historical annual growth in the area. The growth factor will be applied to the existing traffic volumes to establish background traffic.
- Future Transportation Projects – The 2017 TIP and the 2040 LRTP will be reviewed and considered in the analysis at project build-out.
- Committed Developments – The following committed developments will be included in the analysis:
  - Ofizzina
  - University of St. Augustine (at Douglas Entrance)
  - Casa Antilla
- Intersection analysis will be done using Highway Capacity Software (HCS) based on the 2010 *Highway Capacity Manual* (HCM) or the Synchro software. Operation analysis at driveways providing access to/from the site will also be conducted.
- Multimodal Considerations - Pedestrian, bicycle and transit facilities will be defined in a Circulation Plan. Existing bus and mass transit routes including schedule and bus stop locations will be discussed as part of the study.
- Multimodal Analyses – MMLOS analyses will be performed based on LOSPLAN 2012 which uses methodology from the FDOT Quality/Level of Service Handbook. MMLOS analyses will be performed for the following roadway segments:
  - Ponce de Leon Boulevard
  - East Ponce de Leon Boulevard
  - Galiano Street

## **QUEUEING ANALYSIS**

If valet services and/or a gated entrance is provided, a queuing analysis will be conducted. The analysis will be conducted per the methods outlined in the Institute of Transportation Engineers (ITE) Transportation and Land Development. The vehicle queue (M) will be calculated based on processing rate, demand rate, service positions and utilization factor as necessary. The analysis will be done to ensure that there is sufficient on-site vehicle stacking so that there is no vehicle back-up onto the public right-of-way. The potential queue will be calculated based on the peak hour traffic published by ITE's *Trip Generation*, 10<sup>th</sup> Edition.

The project trip generation for the PM peak hour (the critical inbound hour) will be used for the analysis. The processing time will be determined based on data collected at a similar site. Data collected and processing time calculations will be included in the study.

| D18      |         | 9     |        | TBA2-(16,18) |

### Remarks:

This chart shall be used to achieve a standard connection of only one loop per detector channel.

When installed, loops are numbered clockwise beginning at controller site ex L1, L2, L3 etc.

All data shown is based on signal plan, field survey, or controller cabinet schematics.

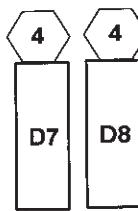

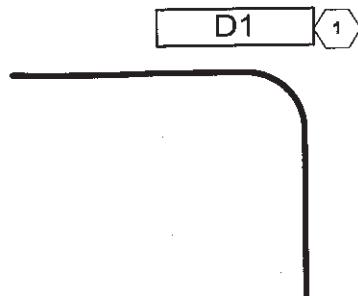

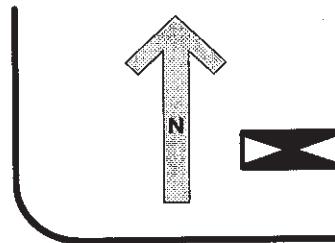

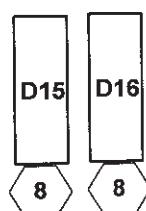

Use the "Detector Rack" table below to assign each loop the corresponding slot # / channel #. When all suggested assignments are used then use, other available slot / channel. Refer to Standard Rack Connection Standardization document for more details.

### SIGNALIZATION NOTES

- 1. SIGNAL CONTROLLER OPERATIONS**
    - A. MODEL 770 CONTROLLER ASSEMBLY WITH COORDINATION CAPABILITIES.
    - B. MAJOR STREET IS PONCE DE LEON BLVD
    - C. MINOR STREET IS SALAMANCA AV
    - D. COORDINATED PHASE ON PONCE ( 5 MOVEMENTS **(2 + 6)** ).
  - D. FLASHING OPERATION:**

YELLOW ON PONCE DE LEON BLVD, ( MOVEMENTS **(2 + 6)** ),  
RED ON SW SALAMANCA AV, ( MOVEMENTS **(4 + 8)** ).
  - E. PEDESTRIAN DISPLAY SHOWN IN CONCURRENCY WITH PHASE 1,  
AND UPON ACTUATION WITH PHASE 2.
  2. LOOP ASSEMBLIES SHALL HAVE THE FOLLOWING MEASUREMENTS:

LEFT TURN LANES 5' x 30'  
THRU & RIGHT TURN LANES 6' x 30'
  3. INTERSECTION DEMAND WATTAGE = 273 WATTS.
  4. TIMING WILL BE PROVIDED BY MIAMI-DADE COUNTY PUBLIC WORKS  
DEPARTMENT SIGNALS AND SIGNS DIVISION, 7100 NW 36 ST.  
TELEPHONE (305) 592-8325.

DETECTORS FOR LOOPS

**NOTES:**  
1. CONTRACTOR SHALL LOCATE AT&T PBX BOX LOCATIONS AT THE EXISTING  
CONTROLLER, AND RUN NEW CONDUIT FROM EXISTING CONTROLLER TO NEW CONTROLLER LOCATION.  
CONTRACTOR SHALL RUN NEW WIRES FOR SPS AND AT&T SERVICE RUNS THROUGH EXISTING

## Intersection Summary

Cycle Length: 180

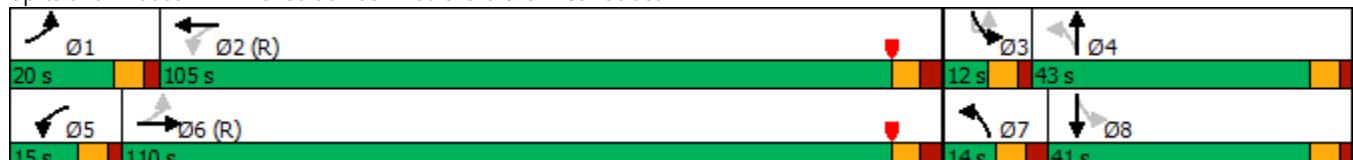

Actuated Cycle Length: 180

Offset: 0 (0%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 100

Control Type: Actuated-Coordinated

Splits and Phases: 1: Ponce de Leon Boulevard &amp; SW 8th Street

#### Intersection Summary

Cycle Length: 190

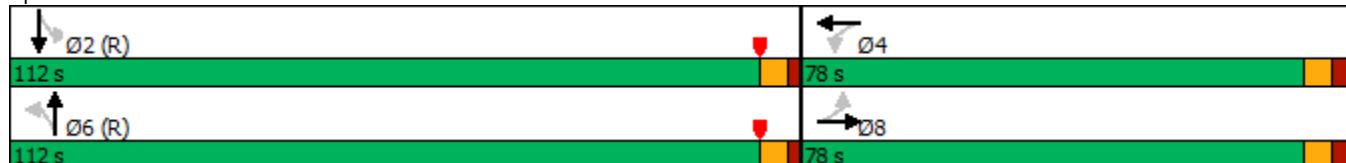

Actuated Cycle Length: 190

Offset: 119 (63%), Referenced to phase 2:SBTL and 6:NBTL, Start of Yellow

Natural Cycle: 60

Control Type: Actuated-Coordinated

Splits and Phases: 5: Ponce de Leon Boulevard & Salamanca Avenue

HCM 6th Signalized Intersection Summary  
5: Ponce de Leon Boulevard & Salamanca Avenue

## Intersection Summary

Cycle Length: 180

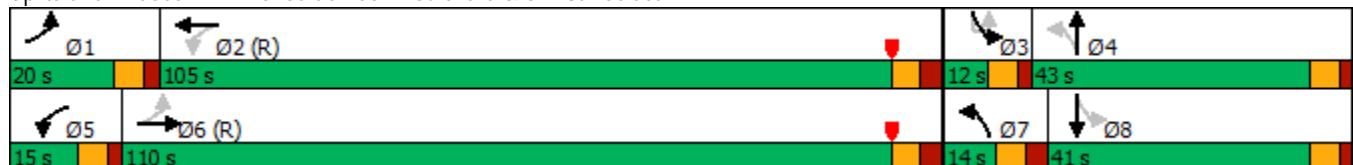

Actuated Cycle Length: 180

Offset: 111 (62%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 100

Control Type: Actuated-Coordinated

Splits and Phases: 1: Ponce de Leon Boulevard &amp; SW 8th Street

Intersection Summary

Cycle Length: 180

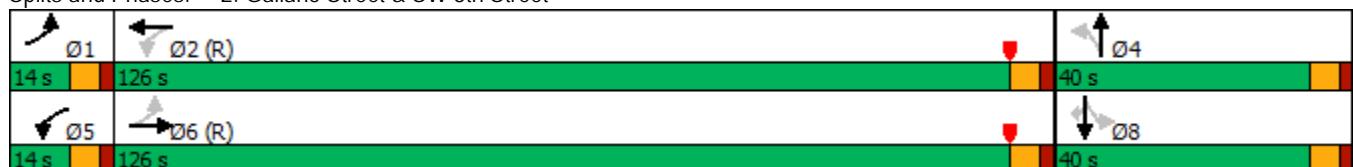

Actuated Cycle Length: 180

Offset: 16 (9%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 75

Control Type: Actuated-Coordinated

Splits and Phases: 2: Galiano Street & SW 8th Street

HCM 6th Signalized Intersection Summary  
3: SW 37th Avenue & SW 8th Street

## Intersection Summary

Cycle Length: 180

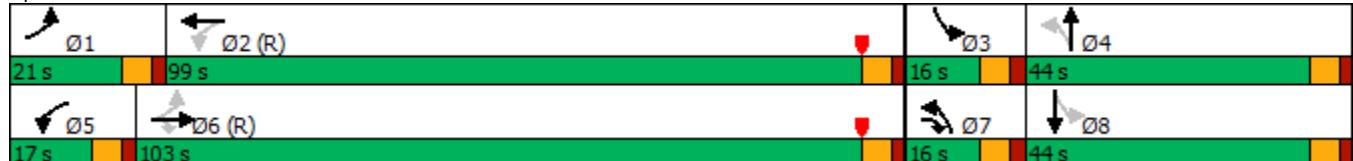

Actuated Cycle Length: 180

Offset: 84 (47%), Referenced to phase 2:WBTL and 6:EBTL, Start of Yellow

Natural Cycle: 90

Control Type: Actuated-Coordinated

Splits and Phases: 3: SW 37th Avenue &amp; SW 8th Street

HCM 6th Signalized Intersection Summary  
3: SW 37th Avenue & SW 8th Street

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\*Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

## Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

### Bus

| A  | B | C | D | E |
|--|---|---|---|---|
| <b>Buses Per Hour In Peak Direction</b>              |   |   |   |   |
| <b>Buses in Study Hour in Peak Direction (Daily)</b> |   |   |   |   |

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

| Buses in Study Hour in Peak Direction (Daily) |   |   |   |   |

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

| = 7.98  | = 5.32 | = 3.99 | = 2.66 | = 1.33 |

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

| Buses in Study Hour in Peak Direction (Daily) |   |   |   |   |

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

# ARTPLAN 2012 Conceptual Planning Analysis

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.

## Bus

| A   | B       | C       | D       | E       |
|---|---------|---------|---------|---------|
| Buses Per Hour In Peak Direction              |         |         |         |         |
| >= 8  | >= 6    | >= 4    | >= 3    | >= 2    |
| Buses in Study Hour in Peak Direction (Daily) |         |         |         |         |
| >= 7.89                                       | >= 5.26 | >= 3.95 | >= 2.63 | >= 1.32 |

\* Service Volumes for the specific facility being analyzed, based on # of lanes from the intersection and segment data screens.

\*\* Cannot be achieved based on input data provided.

\*\*\* Not applicable for that level of service letter grade. See generalized tables notes for more details.

# Under the given conditions, left turn lane storage is highly likely to overflow. The number of directional thru lanes should be reduced accordingly.

## Facility weighted g/C exceeds normally acceptable upper range (0.5); verify that g/C inputs are correct.

### Intersection capacity (ies) are exceeded for the full hour; an operational level analysis tool is more appropriate for this situation.
